
think the raccoons are looking for some kind of place where they can stay forever. Do you know what I mean? That's what I've been thinking lately. Modified septal wall kinesis for treatment of ventricular septal defect in children. To evaluate the safety and efficacy of modified septal wall kinesis in the treatment of ventricular septal defect in children. The modified septal wall kinesis technique was applied to 5 children with ventricular septal defect. Postoperative 1-month follow-up echocardiographic and CT scans were performed. There was no perioperative death or major procedure-related complication. The initial and postoperative mitral valve orifice area were larger, the peak early diastolic filling velocity, the peak early diastolic filling velocity/peak early diastolic mitral annulus motion velocity and the peak early diastolic mitral valve velocity were larger, and the peak atrial systolic mitral flow velocity/peak atrial systolic mitral annulus motion velocity was larger in the modified septal wall kinesis group than in the control group (P 82157476af
